# Automation on Desktop Apps

01

## Theory

---

An introduction to theory, concepts, and strategies

# Introduction

## 01. Manual vs. Automation

### Manual Testing

- ✓ Performed by humans step-by-step
- ✓ Best for **Exploratory & UX** testing.
- ✓ Prone to fatigue & inconsistency.

### Automation Testing

- ✓ Executed by scripts/tools.
- ✓ Best for **Regression & Repetitive** tasks.
- ✓ Fast, precise, consistent.

*"Automation does not replace humans; it liberates them."*

# Introduction

## 02. What is Automation Testing?

### Software Verifying Software

Automation testing is the technique of using specific software (scripts) to control the execution of tests and compare actual outcomes with predicted outcomes.

- ✓ Eliminates repetitive manual tasks.
- ✓ Increases test coverage.
- ✓ Validates software reliability automatically.

**Goal:** Liberate testers from boring tasks to focus on difficult cases.

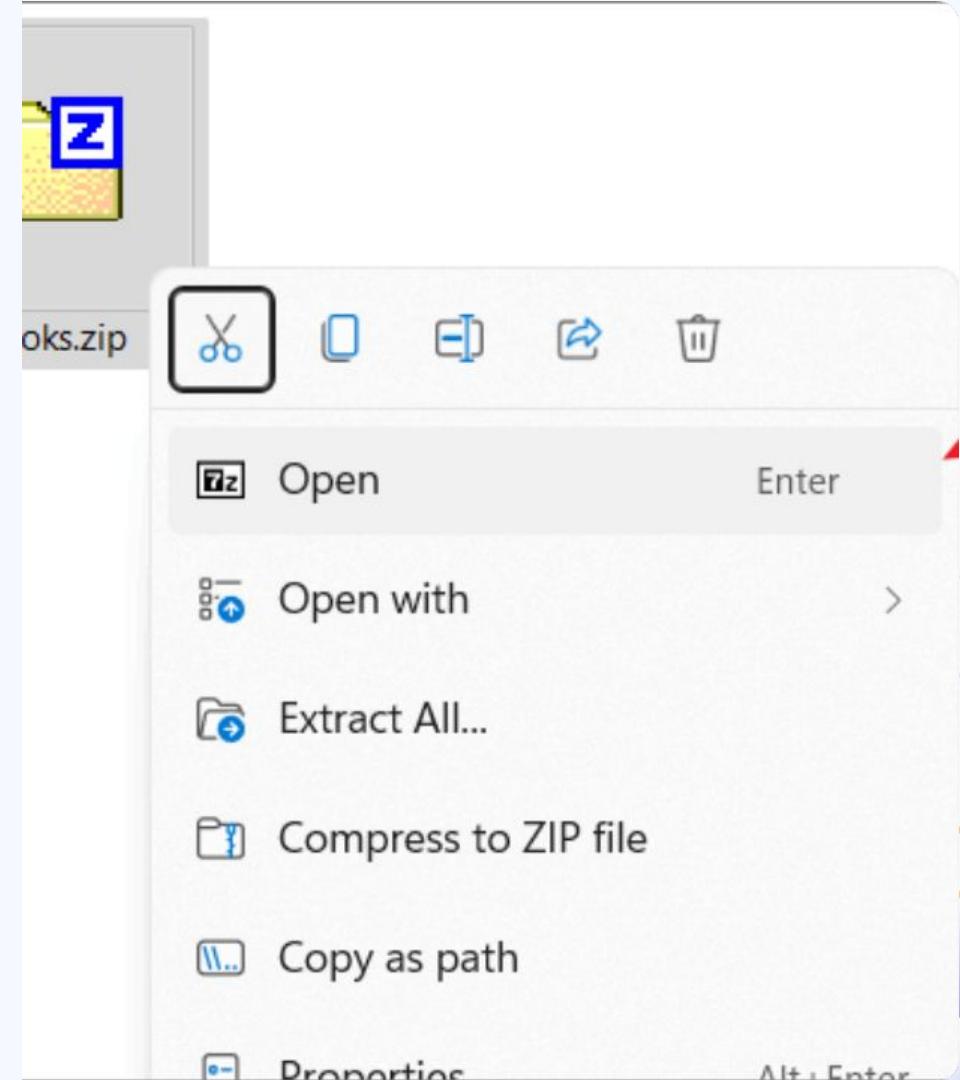

# 03. Desktop App Automation

## Context Specifics

Verifying applications installed directly on the Operating System (unlike Web apps in browsers).

## Key aspects:

- ✓ **GUI Actions:** Clicking, dragging, typing on Windows/Dialogs.
- ✓ **CLI Actions:** Open CMD , type the command and press enter (MAC OS)
- ✓ **Environments:** Validating on Windows Forms, WPF, JavaFX, etc.
- ✓ **System Access:** Interacting with File System & OS permissions.

## 04. Why do we do it?

### Repeatability

Scripts can be executed indefinitely without fatigue,

### Accuracy

Eliminates human error. A machine will strictly follow the script, ensuring precise validation of complex GUI workflows.

### Speed & Effort

Drastically reduces manual effort and accelerates regression testing cycles, allowing faster release of new versions.

## 05. Common Myths

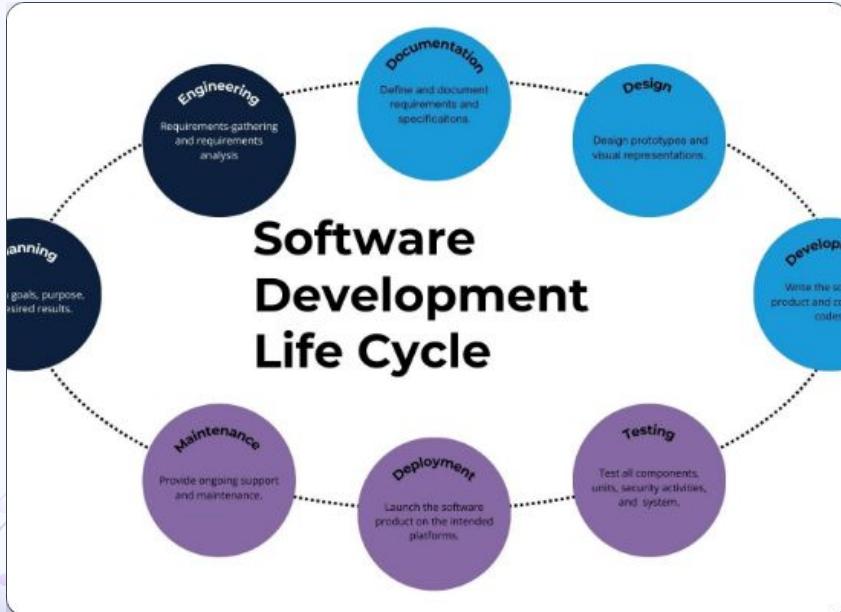

### Myths

- ✗ "Automate **everything**."
- ✗ "Automation **replaces** Manual Testing."
- ✗ "Automation provides **immediate** ROI."

### Reality

- ✓ Only automate stable, repetitive flows.
- ✓ It complements manual testing.
- ✓ ROI is realized in the **long term**.

# 06. Strategy: When to Automate?

### Crucial Phases

Automation is most effective when the application is stable.

- ✓ **Regression Testing:** Ensuring new code doesn't break existing 7-Zip features.
- ✓ **System Testing:** Validating the complete and integrated software.
- ✓ **Acceptance Testing:** Verifying business requirements.

*Best for scenarios where GUI consistency is critical.*

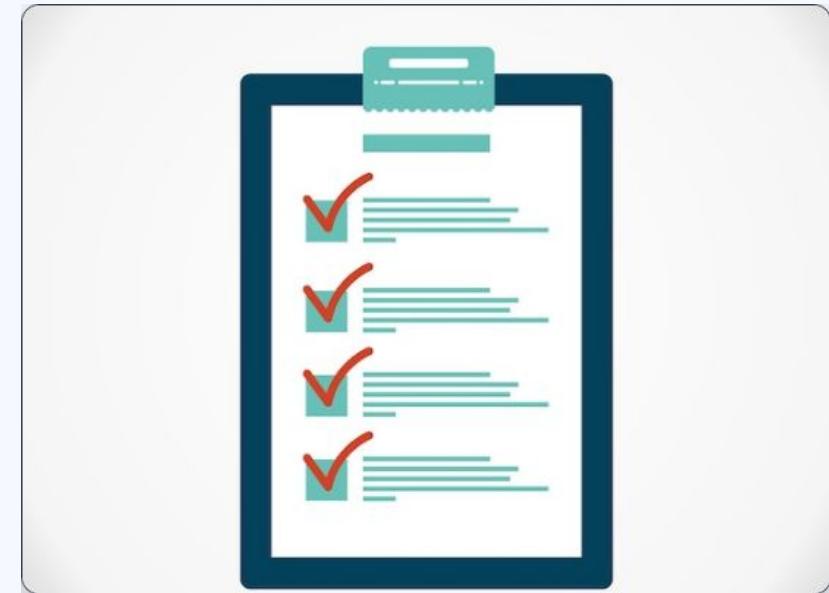

# 07. Strategy: What to Automate? (Where)

## Target Areas

- ✓ **Functional UI Tests:** Core actions like "Add to Archive", "Extract Here".
- ✓ **Smoke Tests:** "Sanity" checks (Does the app launch? Do critical buttons work?).
- ✓ **End-to-End Workflows:** Complete user journey validations.

## What to Avoid

- **Unstable UI:** Features currently in development.
- **Ad-hoc Tests:** One-time checks for edge cases.
- **Visual Aesthetics:** "Is this icon pretty?" (Leave for humans).

## 08. How do we do it?

### Select Tool

pytest, pywinauto, etc.

### Inspect UI

Identify IDs & Elements

### Scripting

Write Action Code

### Run Tests

Execute Framework

### Review

Analyze Results

# 02

# Framework & Tools

---

Introducing SUT, Approaches, Frameworks and Automation  
Tools used

# SUT: 7-Zip

## What is 7-Zip?

- Open-source file archiver
- Compress and Extract files, for example making .zip or .7z archives.

## Why Choose 7-Zip as SUT?

- Stable UI → ideal for GUI automation
- Handles file operations (add, extract, list), easy to validate
- Offers **GUI (Windows)** + **CLI (macOS/Linux)**, enabling multiple test types

# GUI Automation Path (Windows)

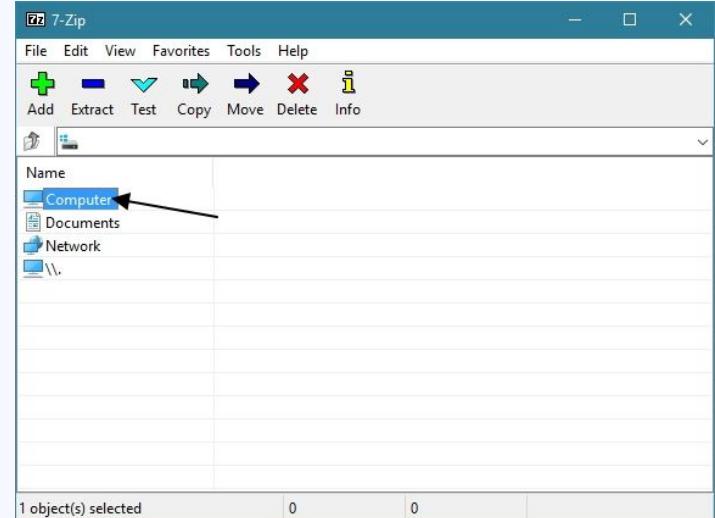

We automate **7-Zip File Manager** on Windows.

Key tools:

- **Pywinauto** – controls the 7-Zip window  
(click buttons, type text, choose options, open dialogs)
- **pytest** – runs the test functions and checks the results

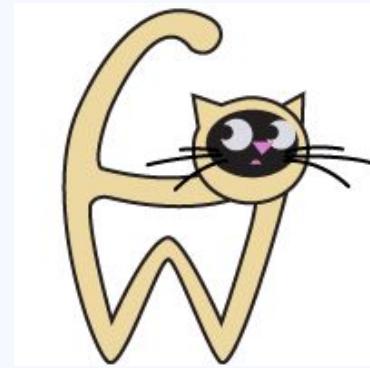

Typical actions:

- Open 7-Zip File Manager
- Add files → create archive
- Extract archive → verify result

# Automation Tool: Pywinauto

- Python library for Windows GUI applications
- Allows direct interaction with native Windows controls—such as buttons, menus, and text boxes
- Uses Win32 API or UI Automation backend.

# Why choosing Pywinauto

- **Fast and simple setup:** installable with one command (`pip install pywinauto`) without external drivers.
- **Full Windows compatibility:** works seamlessly on Win32, WPF, and WinForms apps.
- **Readable API:** supports intuitive commands like `.Edit.type_keys()` and `.MenuSelect()`.

# Tools Comparison

Aspect	Pywinauto	WinAppDriver	Autolt
<b>License</b>	MIT (open-source)	Open-source (Microsoft)	Freeware (closed)
<b>Scripting Language</b>	<b>Python</b>	C#, Java, etc. (WebDriver style)	Autolt Basic (custom language)
<b>Integration with pytest</b>	<b>Native &amp; direct (pure Python)</b>	Needs extra bindings + wrapper	Needs bridge (run Autolt scripts from tests)

# Tools Comparison

Aspect	Pywinauto	WinAppDriver	AutoIt
<b>Best Use Case</b>	<b>Automating classic Windows apps from Python test frameworks</b>	Enterprise .NET apps, Small large teams using WebDriver ecosystem	Windows-only scripts, admin tools
<b>Learning Curve</b>	Easy for anyone who knows basic Python	Steeper (WebDriver concepts, more setup/layers)	Need to learn a new proprietary language
<b>Chosen?</b>	Yes	No	No

# Testing Framework: pytest

- Python testing framework used to execute and manage test cases.
- It automatically discovers functions whose names start with `test_` in files `test_*.py` and reports results.

# Why choosing pytest

- Clean and minimal syntax; easy to integrate with Pywinauto scripts.
- Generates readable command-line output and supports **HTML reporting** via plugins ([pytest-html](#)).
- Supports **core functionalities** such as **assertions**, **fixtures**, and **parameterization**

# CLI Automation Path (macOS)

For platforms without 7-Zip GUI (like macOS), we automate using the **7z command-line**.

Main idea:

- Use `subprocess.run()` to execute commands like:

- `7z a archive.7z file.txt`

- `7z x archive.7z -pPASSWORD`

pytest is still the **runner**, but instead of Pywinauto, tests call the CLI, then check the return code and output.

# CLI Libraries & pytest Integration

## **subprocess**

- Runs `7z` commands and captures output / return code

## **openpyxl**

- Reads multiple test data from Excel file where each line is 1 test case

## **zipfile and py7zr**

- Programmatically open `.zip` and `.7z` archives
- Used to validate that archives created by 7-Zip are actually valid or not

# CLI Libraries & pytest Integration

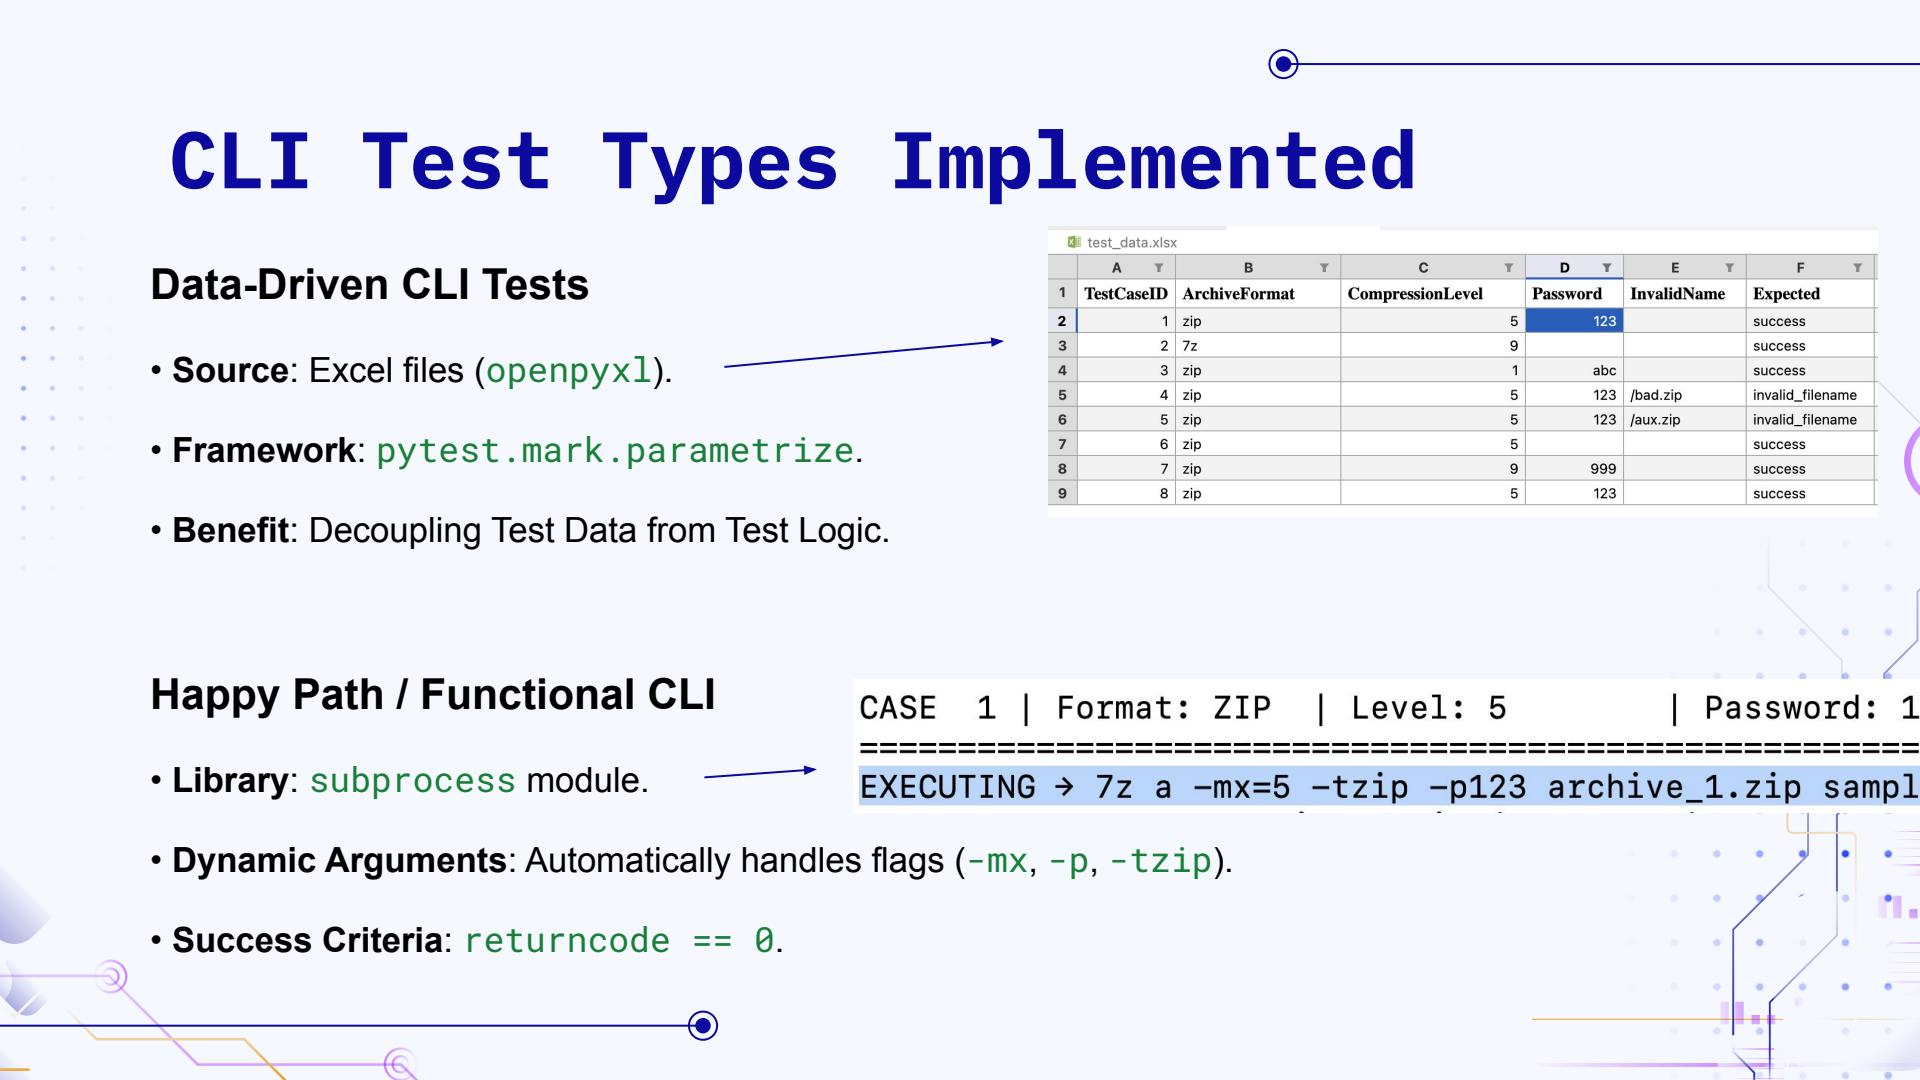

## pytest integration

- All CLI tests are normal **pytest test functions** (with `assert`).
- **Fixture** (`setup_test`) → create temp folder + sample file before each test.
- **parametrize** (`@pytest.mark.parametrize`) → run the same test for every row in the Excel test cases data.

# CLI Test Types Implemented

## Data-Driven CLI Tests

- **Source:** Excel files ([openpyxl](#)).
- **Framework:** `pytest.mark.parametrize`.
- **Benefit:** Decoupling Test Data from Test Logic.

A screenshot of an Excel spreadsheet titled "test\_data.xlsx". The table has columns A through F. Column A is labeled "TestCaseID", column B is "ArchiveFormat", column C is "CompressionLevel", column D is "Password", column E is "InvalidName", and column F is "Expected". The data rows are as follows:

A	B	C	D	E	F
TestCaseID	ArchiveFormat	CompressionLevel	Password	InvalidName	Expected
1	zip	5	123		success
2	7z	9			success
3	zip	1	abc		success
4	zip	5	123	/bad.zip	invalid_filename
5	zip	5	123	/aux.zip	invalid_filename
6	zip	5			success
7	zip	5			success
8	zip	9	999		success
9	zip	5	123		success

## Happy Path / Functional CLI

- **Library:** `subprocess` module.
- **Dynamic Arguments:** Automatically handles flags (`-mx`, `-p`, `-tzip`).
- **Success Criteria:** `returncode == 0`.

```
CASE 1 | Format: ZIP | Level: 5 | Password: 1  
=====  
EXECUTING → 7z a -mx=5 -tzip -p123 archive_1.zip sample
```

# CLI Test Types Implemented

## Validation Tests

- **Advanced Verification:** Beyond simple `os.path.exists`.
- **Cross-check:** Utilizing 3rd-party libs (`zipfile`, `py7zr`) to extract and verify.
- **Goal:** Ensure Data Integrity (Not corrupted).

## Negative CLI Tests

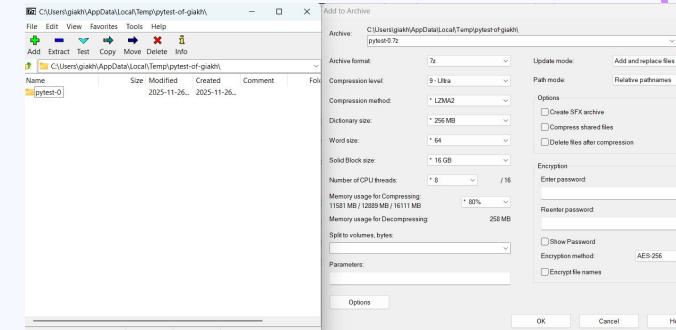

- **Error Capture:** Capturing `stderr` stream.
- **Validation:** Asserting `returncode != 0`. 
- **Keyword Matching:** Scanning for "error" or "permission" in logs.

```
CASE 4 | Format: ZIP | Level: 5
=====
EXECUTING → 7z a -mx=5 -tzip -p123 /bad.zip
EXPECTED ERROR → Return code: 2
STDERR → System ERROR:
Unknown error: -2147024866
NEGATIVE TEST → PASSED (7-Zip correctly rejected)
PASSED
```

# GUI Test Types Implemented

## Data-Driven GUI Tests

- **Reusability:** Reusing `test_data.xlsx` from CLI.
- **Consistency:** Ensures consistent testing across interfaces.

## Happy Path / Functional GUI

- **Library:** `pywinauto` (UIA Backend).
- **Synchronization:** Smart `wait('visible')` instead of hard `sleep`.
- **Workflow:** Simulates user actions (Select File -> Add to Archive -> OK).

# GUI Test Types Implemented

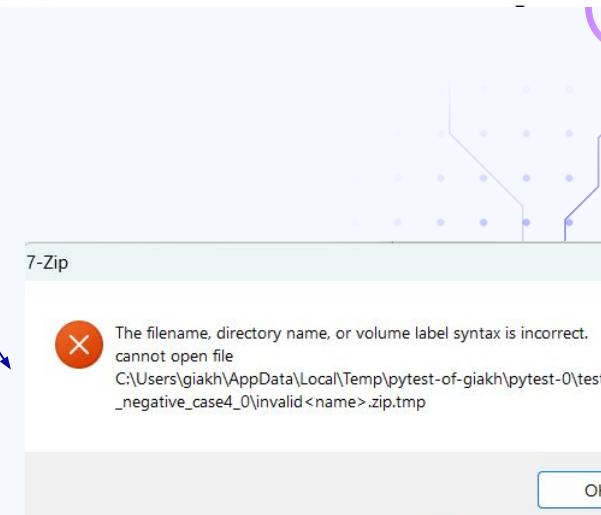

## Validation Tests

- **Hybrid Approach:** UI execution with Backend verification.
- **Check:** Verify output file existence and integrity after UI processing.

```
[INFO] Case ID: 1 | Format: zip | Level: INFO  
[INFO] processing compression...  
[PASS] Case 1 validation successful.  
PASSED
```

## Negative GUI Tests

- **Popup Detection:** Auto-detecting Error Windows (System & App level).
- **Assertion:** Verifying error message content against expected results.
- **Self-Healing:** Auto-closing popups to clean the environment.

# 03

# Demo

---

Demo with App 7-Zip on Windows & Mac Os

# GUI

The screenshot shows a software interface with a toolbar on the left containing various icons. At the top, there's a search bar with the text "7zip-automation". Below the search bar, two files are listed: "clean\_gui.py 5" and "test\_data.xlsx". A large data grid occupies the central area, with columns labeled A, B, C, D, and E. The rows are numbered from 1 to 16. The data in the grid is as follows:

	A	B	C	D	E
1	id	format	level	pwd	expected
2		1 zip	3 - Fast		success
3		2 7z	9 - Ultra		success
4		3 tar	0 - Store		success
5		4 zip	3 - Fast	123	success
6		5 zip	5 - Normal		invalid_name
7		6 zip	5 - Normal		password_mismatch
8					
9					
10					
11					
12					
13					
14					
15					
16					

At the bottom, there are navigation buttons (back, forward, search) and a status bar with the text "Trang tính1".

The screenshot shows an Anaconda Prompt window with the following command-line history:

```
(base) C:\Users\giakh>conda env list
# conda environments:
# *  -> active
# + -> frozen
base                  *  C:\Users\giakh\miniconda3
7zip-gui              C:\Users\giakh\miniconda3\envs\7zip-gui
lab2_cv_homework      C:\Users\giakh\miniconda3\envs\lab2_cv_homework

(base) C:\Users\giakh>conda activate 7zip-gui
(7zip-gui) C:\Users\giakh>cd Desktop/7zip-automation
(7zip-gui) C:\Users\giakh\Desktop\7zip-automation>cd gui
(7zip-gui) C:\Users\giakh\Desktop\7zip-automation\gui>
```

# CLI

The image shows a Mac desktop interface with the following elements:

- Terminal:** A window titled "7zip-automation" showing a zsh shell. The command entered is "(7zip-test) giakhangha@Gias-MBP 7zip-automation %".
- Spreadsheet:** An Excel spreadsheet titled "test\_data.xlsx" containing test data for 7zip CLI automation. The data is organized into columns: TestCaseID, ArchiveFormat, CompressionLevel, Password, InvalidName, and Expected.
- Sidebar:** A vertical sidebar on the left side of the desktop.

The "test\_data.xlsx" spreadsheet data is as follows:

TestCaseID	ArchiveFormat	CompressionLevel	Password	InvalidName	Expected
1	zip	5	123		success
2	7z	9			success
3	zip	1	abc		success
4	zip	5	123	/bad.zip	invalid_filename
5	zip	5	123	/aux.zip	invalid_filename
6	zip	5			success
7	zip	9	999		success
8	zip	5	123		success
